

CSC 211: Computer Programming

Introduction to C/C++

Michael Conti

Department of Computer Science and Statistics
University of Rhode Island

Fall 2023

Original design and development by Dr. Marco Alvarez

Administrative notes

Administrative notes

- › A00 Groups have been assigned
 - Due 09/17/2023
- › Lab#01 Out
 - Due 09/15/2023
- › Are you on Piazza?
 - Get the app!
- › Are you on Gradescope?
- › Discussion sessions Next Week
- › Communication Preference
 - Piazza Only

Algorithms and Programs

Problems, Algorithms and Programs

• Problem

- ✓ task to be performed (precisely defined)
- ✓ well-defined **inputs** and **outputs**
- ✓ may include constraints

• Algorithm

- ✓ set of concrete steps required to solve a problem
- ✓ properties:
 - it must be correct (must compute the desired function)
 - it is composed of a series of concrete and finite number steps
 - there can be no ambiguity as to which step will be performed next
 - it must terminate

5

Problems, Algorithms and Programs

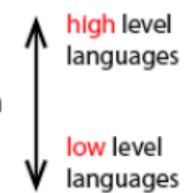

• Program

- ✓ instantiation of an algorithm using a programming language

Snap, Scheme, Prolog, Lisp

JavaScript, Python, Java, Alice, Scratch

C, C++

<https://bjc.edc.org/bjc-r/cur/programming/6-computers/1-abstraction/03-software-languages.html>

6

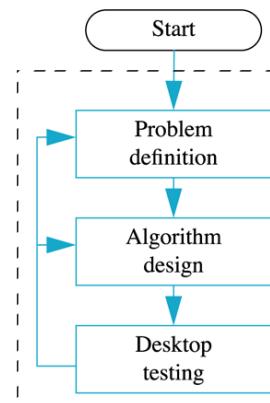

Example

An Algorithm

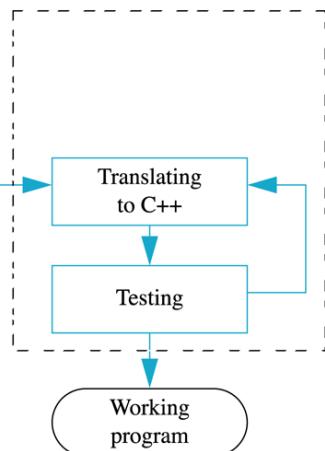

Algorithm that determines how many times a name occurs in a list of names:

Program Design Process

Problem-solving phase

Implementation phase

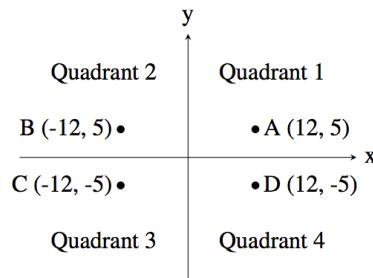

Example

Read a point from user and determine the quadrant it is in. You can assume that neither of the two coordinates will be 0

```
read first number into num1
read second number into num2
if num1 and num2 are positives
    print "Quadrant 1"
else if num1 is positive and num2 is negative
    print "Quadrant 2"
else if num1 is negative and num2 is negative
    print "Quadrant 3"
else
    print "Quadrant 4"
```

<https://open.kattis.com/problems/quadrant>

9

Example (program)

```
# read numbers
num1 = input('Enter first number: ')
num2 = input('Enter second number: ')

# perform selection
if num1 > 0 and num2 > 0:
    print('Quadrant 1')
else if num1 > 0 and num2 < 0:
    print('Quadrant 4')
else if num1 < 0 and num2 < 0:
    print('Quadrant 3')
else:
    print('Quadrant 2')
```

10

Example (program)

```
#include <iostream>

int main() {
    // read numbers
    int num1, num2;
    std::cout << "Enter first number: ";
    std::cin >> num1;
    std::cout << "Enter second number: ";
    std::cin >> num2;
    // perform selection
    if (num1 > 0 && num2 > 0) {
        std::cout << "Quadrant 1\n";
    }
    else if (num1 > 0 && num2 < 0) {
        std::cout << "Quadrant 2\n";
    }
    else if (num1 < 0 && num2 < 0) {
        std::cout << "Quadrant 3\n";
    }
    else {
        std::cout << "Quadrant 4\n";
    }
}
```

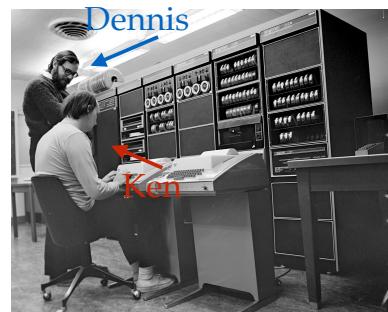

<https://godbolt.org/z/OFwd6N>

11

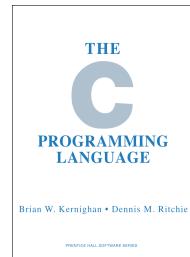

C/C++

History

- Ken Thompson created the B language while developing UNIX (implemented in assembly) at Bell Labs [1970]
 - ✓ slow and interpreted

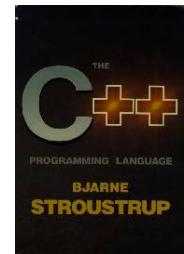

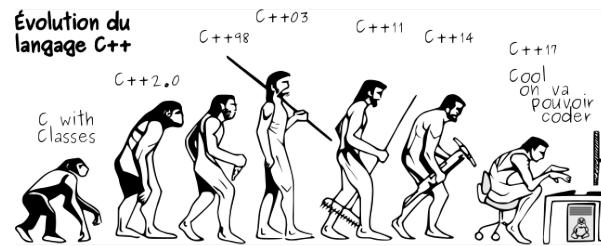

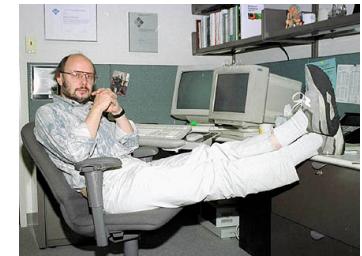

- Dennis Ritchie began development of a compiler for B and could produce executable code [1972]
 - ✓ became known as the C language
 - ✓ Linux kernel reimplemented in C

13

History

- Bjarne Stroustrup began the development of C++ (also from Bell Labs) [1980]
 - ✓ object oriented, generic, functional

<https://github.com/cpp-frug/materials/tree/gh-pages/images>

14

C++?

- Static type system
 - ✓ prevents unintended operations
 - ✓ optimized machine code (i.e. faster and/or using less memory)
- Object oriented language
 - ✓ improves maintainability
- When to use it?
 - ✓ performance matters
 - ✓ developing time is less important
 - ✓ specialized libraries require it

15

C/C++?

- Pros
 - ✓ vast documentation freely available
 - ✓ provides different levels of abstraction (from data structures to memory management)
 - ✓ it is compiled
 - ✓ high performance
- Cons
 - ✓ steep learning curve
 - ✓ large language
 - ✓ no automatic memory management (can be an advantage)
 - ✓ requires attention to minor details
 - ✓ GUIs only available through extensive libraries (less portable)

16

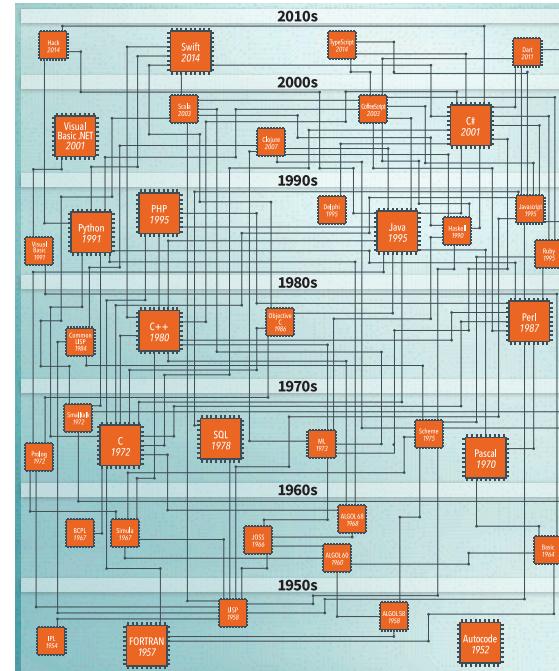

Console applications

The screenshot shows the CS50 IDE interface. At the top, there's a menu bar with File, Edit, Find, View, Go, and a Share button. Below the menu is a toolbar with icons for workspace, file operations, and collaboration. The main area displays a code editor with a file named 'hello.c' containing the following code:

```
1 #include <stdio.h>
2
3 int main(void)
4 {
5     printf("hello, world\n");
6 }
7
```

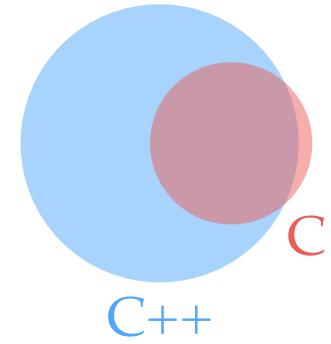

Below the code editor is a terminal window showing the command 'workspace/' followed by a dollar sign '\$'. On the right side of the interface, there are tabs for Collaborate, Outline, and Debugger.

19

Compilers

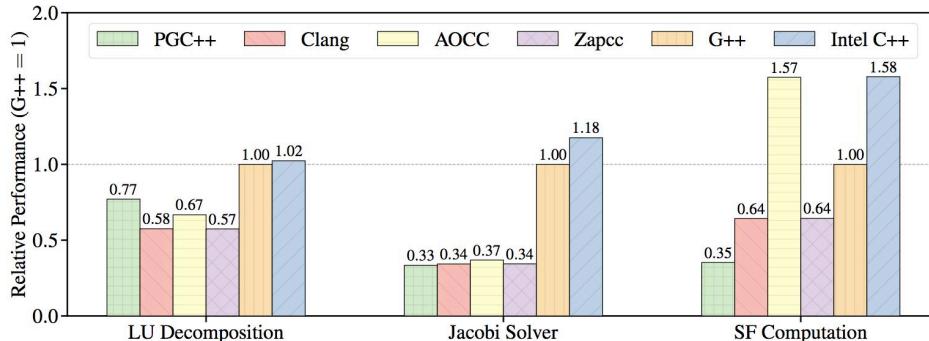

- A computer program that ...
 - ✓ translates source code from one programming language to another (usually from high-level to low-level languages)
 - ✓ performs code optimizations
 - ✓ provides error checking

Correctness is paramount. Compilers cannot afford to fail.

20

C++ Compilers

single-threaded, higher is better

21

```
#include <iostream>
```

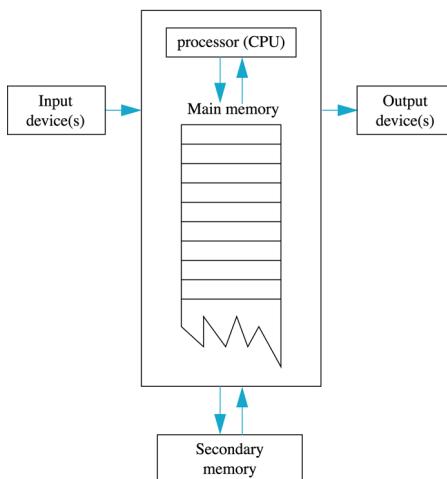

```
int main()
{
    std::cout << "Hello World!" << std::endl;
    return 0;
}
```

```
~/workspace/ $ g++ hello.cpp -o hello
~/workspace/ $ ls -l
total 16
-rwx----- 1 ubuntu ubuntu 9176 Sep 10 15:21 hello*
-rw----- 1 ubuntu ubuntu    91 Sep 10 15:20 hello.cpp
~/workspace/ $ ./hello
Hello World!
~/workspace/ $
```
