# CSC 211: Computer Programming Introducing loops (for)

### Michael Conti

Department of Computer Science and Statistics University of Rhode Island

Fall 2023

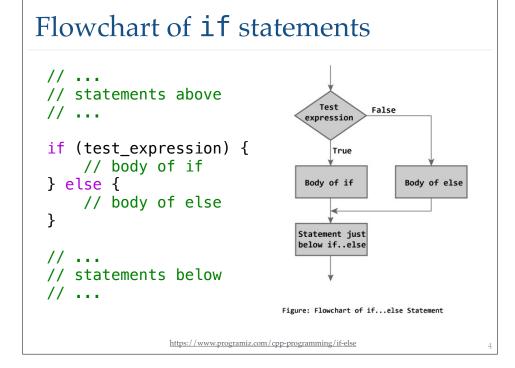

# // ... Test expression // statements above // ... if (test\_expression) { // body of if } Statement just below if // statements below

https://www.programiz.com/cpp-programming/if-else

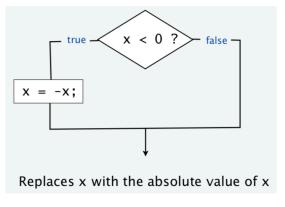

Flowchart of if statements

Figure: Flowchart of if Statement

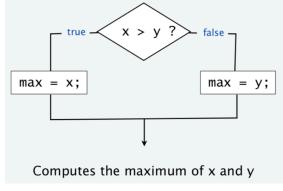

# if statement examples

```
Example: if (x < 0) x = -x;
```

# if statement examples

Example: if (x > y) max = x; else max = y;

# The increment/decrement operators

https://introcs.cs.princeton.edu/java/lectures/

- Increment (++) and decrement (--) are unary operators that add or subtract one, to or from their operand, respectively
  - pre-increment and pre-decrement operators increment (or decrement) their operand by 1, and the value of the expression is the resulting incremented (or decremented) value
  - post-increment and post-decrement operators increase (or decrease) the value of their operand by 1, but the value of the expression is the operand's original value prior to the increment (or decrement) operation

# The increment/decrement operators

· Example:

int 
$$a = 5$$
;

V.S

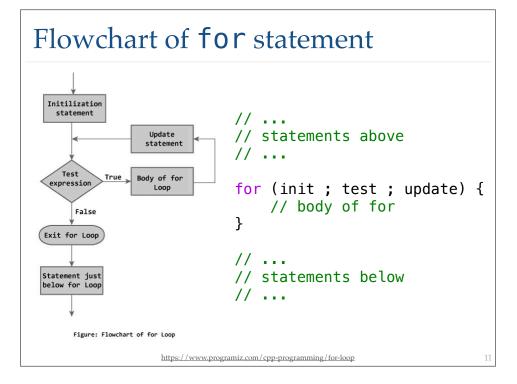

int 
$$a = 5$$
;

from: wikipedia

## Trace the code

```
int x;
int y;
x = 1;
y = ++x;
// Checkpoint a (status of x and y?)
y = x++;
// Checkpoint b (status of x and y?)
x = 5;
y = x--;
// Checkpoint c (status of x and y?)
y = --x;
// Checkpoint d (status of x and y?)
```

# the for loop

### A for Statement //Illustrates a for loop. #include <iostream> using namespace std; Repeat the loop as int main() long as this is true. Done after each int sum = 0;loop body iteration for (int n = 1; n <= 10; n++) //Note that the variable n is a local //variable of the body of the for loop! sum = sum + n: cout << "The sum of the numbers 1 to 10 is "</pre> << sum << endl: return 0; } Output The sum of the numbers 1 to 10 is 55 from: Problem Solving with C++, 10th Edition, Walter Savitch

```
What is the output?

int value = 0;

for (int i = 0 ; i < 5 ; i++) {
    value += (i * 10);
}

std::cout << value << std::endl;</pre>
```

```
Examples
int n = 1;

for (; n <= 10; n = n + 2)
    std::cout << n << std::endl;

for (n = 10; n > 0; n -= 2) std::cout << n << std::endl;

for (n = 0; n > -30; n = n - 7) {
    std::cout << n << std::endl;
}

for (double x = 16.0; x >= 2.0; x = sqrt(x)) {
    std::cout << x;
    std::cout << std::endl;
}</pre>
```

# What is the output?

```
for (int count = 1 ; count <= 10 ; count++);
    std::cout << "Hello\n";</pre>
```

### Careful with the semi-colon

- · Semi-colon is used to end statements
- Placing it after the parenthesis of a for loop creates an empty statement

# Different output?

# Question

 Write a single for loop to print the first 50 even numbers

9

# Question

• Write a single for loop to print the average of the first 25 multiples of 3
